AutoCAD Crack

General customization - General customization includes auto-creation of command menus, custom command bars, toolbar buttons, ribbon tab items, and the ability to create/delete many toolbars. An example of a command created via customizability is the "Slice View" command that was created by Keith Melland. These are easily programmable, though can be a bit complex to create and maintain. You can also create custom routines through Microsoft Windows API by injecting into AutoCAD's DLL. For example, you can use functions from other programs, or you can write your own custom drawing routines to create rasterized and vector-based layouts. AutoCAD 2007 added an API for macros. AutoCAD uses a native file format and data structures to store drawing information, with support for text, geometry, symbols, and compound objects. Drawing data is stored as a collection of datasets. AutoCAD has an integrated object-oriented class library based on the Component Object Model (COM) standard. COM objects can be used in AutoCAD for automation and customizability. In AutoCAD (prior to version 2011), it was possible to create custom buttons to insert the actual drawings within the drawing canvas. This was useful for creating buttons like "Print" to print the main drawing. This functionality was dropped in 2011 with the release of AutoCAD LT. So far, I have been able to do some basic logging, but am having some trouble with the configuration. I think I'm basically doing this correctly, but the Apache error log keeps showing as "0" even though I'm catching the 500 error. Here is my configuration in the server block for ca3bfb1094

Q: How to create a generic, typed ArrayList of custom class I am trying to write a generic class that will take in a custom class and then add it to a List as a value. This is my code: public abstract class GenericList { protected List list = new ArrayList(); public List addToList(T element) { list.add(element); } public List removeFromList(T element) { list.remove(element); } } How can I make the generic type "T" to be whatever type is declared in the object that is added to the list? So for example, if an ArrayList is declared to hold objects of type Person, I want the addToList method to take an object of type Person. A: You can't. At compile time, a List always has to know what the type of T is, as it's generated by the compiler from T. That's why List is also generic, you can't have the same class for several different types. A: You can't. You can't add items to lists of different types, they are specific to the type of the list, not the generic type. EDIT: That said, you may be able to come up with something by adding a getItemType() method to the class, and using the Class.cast(Object o) method to test the type, like this: public abstract class GenericList
