Adobe Photoshop has played a prominent role in the development of film and post-production. It is a widely renowned tool, and many companies rely on the application's top-of-the-line features for their projects. A major shift took place in the adoption of digital design for magazines in the mid-2000s, when editorial teams noticed the superiority of digital editorial over the use of film in magazine creation. As well as creating images of all sizes, shapes and window edges, Photoshop is used to prepare a range of files for publication. In the 1950s, the term "graphics designer" was generally applied to artists. However, Adobe Photoshop, a widely used commercial image-editing application and part of the Adobe Creative Suite, quickly demonstrated the viability of so-called graphics designers as a separate group. Photoshop transformed the way people create and manipulate images, and the evolution of the program into a full-fledged graphics designer's tool made many new jobs possible. Once an image was created, it could be turned into a digital or printed format. The ability to manipulate the final product raised the capabilities of the average user. Photoshop, originally named "Photoshopped", was created by John Knoll in the late 1980s, as a clone of the Macintosh-only software MacPaint, which included a rudimentary drawing program named "Croquis". While Photoshop is considered a graphics design program, it became immensely popular, especially for its image-editing capability, which allows users to change the look of an image and add effects through a wide array of tools.

The new features in Photoshop Lightroom are mainly aimed at the merging of images into a smart image, and then also smarts can be accomplished within Photoshop. As the merger of images is so important, we have redesigned this feature in a more intuitive way. We added a number of new features to make the workflow more streamlined, and the user interface more intuitive. In the History panel, you can now see the history for all panels, and any changes you made retain this information. Now instead of capturing edits, design changes to layer styles, filters, etc is automatically synced back to your Photoshop file. If a change is made to the file, it shows up in the design space in real time - enabling users to visually confirm that the design changes they made are accurate. They can then make any necessary edits which they normally shouldn't have to do through a web-based interface, simply back in to Photoshop and make those changes. This is all possible thanks to AXURE 's open source platform. Currently available in GitHub , the team is actively welcoming feedback, and want to hear from the community what their experiences have been with the service. You can read more about the service and learn more about it over at Axure . We have also updated the Creative SDK with support for design services, which makes it easier to leverage the service with apps built through Adobe Creative SDK. For more information on the SDK visit the Creative Cloud blog .
